Let's Start!

Let's learn about language syntax.

Learning Outcome:

Understand key information about the concepts, principles, and methodologies in simple spoken and written situations. Talk about programming techniques, use cases, kinds, and sequences in simple spoken and written situations.

Can Do Statements:

- I can understand the concept of language syntax.
- I can exchange information about language syntax.
- I can identify key features related to language syntax.

Ask your partner:

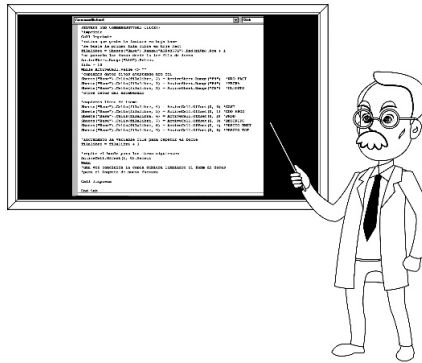

- Do you consider the structure of sentences important? Why?
- What structural characteristics do you think programming languages have in common?

Let's Explore!

A job interview!

Instructions: Read the text below.

Julian: Good Morning!

Caroline: Good Morning. Please have a sit. So, you are here for our programming assistant teacher job, right?

Julian: Yes, ma'am.

Caroline: Can I have your CV?

Julian: Here you are!

Caroline: Ok, can I ask you some questions?

Julian: Sure.

Caroline: Can you tell me what language syntax is?

Julian: Well, everything you have to know is that a computer language describes the possible combination of some symbols that define legal programs. You need to consider this information when you have a structured document or piece of data.

Caroline: When do you use it?

Julian: You can use language syntax in all programming languages. Also, it has some specific rules that depend on various factors, for example, the purposes of its use and the way programmers execute the document or data.

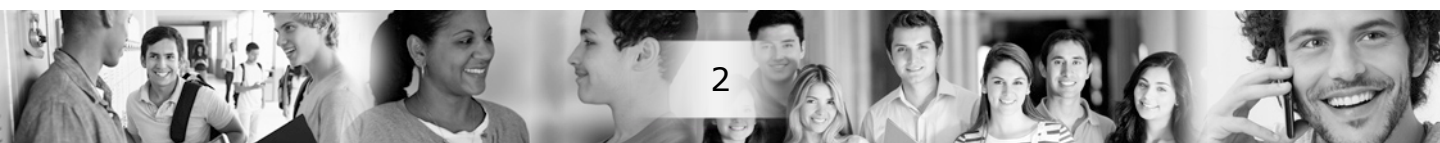

Caroline: How can you explain this matter in a classroom?

Julian: Well, I can say that language syntax is usually a combination of expressions or tokens to specify the categories and characters from which programs are created.

Caroline: Does language syntax have any distinctive features?

Julian: Some basic features of a language's syntax are associated with sequence levels. The first one is related to words that regulate how characters generate tokens; It usually focuses on the lexical analysis. Another is related to phrases that form something we called grammars. It organizes sequences of tokens into a hierarchical syntax tree. The third refers to the context that determines what object names refer to and if they are valid.

Caroline: Ok, your explanation is very impressive indeed. We'll analyze your CV and we'll call you soon. So far, there is nothing else we can do.

Let's Practice!

Julian provides some information about language syntax

Instructions: Proofread the sentences. Correct the mistakes.

1. I know anything about language syntax, but I read you can use it in all programming computers.
2. It's better not to say something, if you don't know the matter.
3. Language syntax has any rules for programming in all languages.
4. Everyone I know is that language syntax rules depend on different factors like its purpose.

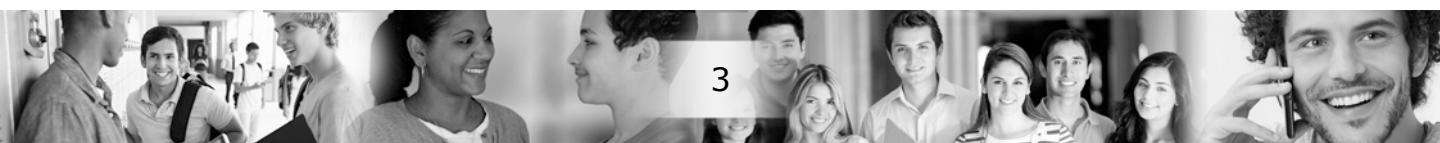

Let's Practice!

Julian explains some key features of language syntax!

Instructions: Classify the sentences by writing the number of the sentence in the correct category.

1. It is a set of symbols that conform tokens.
2. It is a set of characters.
3. It adds meaning and interpretation to the syntax.
4. It determines how tokens form phrases.
5. It validates and checks types.
6. It consists of sequences of tokens in a hierarchical syntax tree.
7. It is the smallest lexical level.
8. It makes sense of the object names.
9. It conforms the grammar level.

Words	Phrases	Context

Extension Activity

Let's Write About Language Syntax and Semantic Use!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Find information about language syntax.
- Choose the most important information.
- Write a short paragraph about language syntax using the grammar points covered in this unit.
- Share your ideas with your partners.

Self-Assessment

- I find information about language syntax.
- I choose the most important information.
- I write a short paragraph using the structures covered in this unit.

Yes

No

☐ ☐
☐ ☐
☐ ☐

Target Words

- **CV** (noun): it is the abbreviation of the term 'Curriculum Vitae', this refers to a summary of the life of a person.
e.g. Do you have your CV?
- **syntax** (noun): the correct arrangement of words in a sentence.
e.g. Can you tell me what language syntax is?
- **token** (noun): it is the basic component of a computer program with different functions according to the programming rules.
e.g. Well, I can say that language syntax is usually a combination of expressions or tokens to specify the categories and characters from which programs are created.
- **distinctive** (adjective): It is when something is peculiar or specific.
e.g. Well... Does language syntax have any distinctive features?
- **matter** (noun): it is the subject or that people study in a course.
e.g. How can you explain this matter in a classroom?
- **regulate** (verb): the activity of writing computer program.
e.g. The first one is related to words that regulate how characters generate tokens.

Learning Points

Indefinite Pronouns: Everything, Nothing, Some

You use **Indefinite pronouns** to refer to people or things in general; this is, you don't specify who or what they are.

There are different **Indefinite Pronouns**. to refer to people or things. When we refer to people we use the ending **body** or **one**; Use the ending **thing** if you are talking about objects. The most common indefinite pronouns are everything, nothing, and something (for objects); and everybody, no one and someone (for people)

For example:

Everything is in the bag.

Remember that you do not use any negative indicator when you have the indefinites nobody (no one) or nothing in your sentence.

Examples:

There is **nothing** I can teach you.

There's **no one** here.

When you use **Indefinite Pronouns** you use a singular verb after the pronoun.

For example:

- Everybody **has** a computer.
- **Nothing** is ready for the project.

You can also add **-s** to an indefinite when you use a possessive.

For example:

- The students are in **somebody's** house.
- Is this **anybody's** laptop?

In the next chart you can see some examples of indefinite pronouns.

anybody	anyone
anything	everybody
nobody	none
everybody	everything
no one	someone
somebody	someting
all	another
any	both

Learning Points

neither	many / much
several	Less / Little

Examples

- *Well, everything you have to know is that a computer language describes the possible combination of some symbols that define legal programs.*
- *Also, it has some specific rules that depend on various factors*
- *Another, is related to phrases that shape something that we called grammars.*

Modal Can for Ability to Talk about Language Syntax

You use the modal verb **can** or **can't** in the negative form, to talk about abilities or inabilities.

Use the modal verb **can** and its negative form **can't** to express the abilities, or lack of abilities, of a person, animal, or thing. **Can** is a modal verb; that means, can doesn't have any particular conjugation. Can is always the same to all pronouns.

Example:

He can program computers.

I can program computers too.

Can doesn't need an auxiliary verb neither; if you want to mention an inability, you just add the particle not to the verb can or use the contracted verb can't.

Examples:

We **cannot** understand the grammar.

He **cannot** read grammars.

You always use a verb in **infinitive** with no prepositions after can.

Example:

- We can **read** the statements.

Subject	CAN	Infinitive
I	can	program.
She	can	Design.

Examples

- *You can use language syntax in all programming languages.*
- *Well, I can say that language syntax is usually a combination of expressions or tokens to specify the categories and characters from which programs are created.*
