Let's Start!

Something Important Regarding Software Programming

Learning Outcome:

Understand key information about the concepts, principles, and methodologies in simple spoken and written situations. Talk about programming techniques, use cases, kinds, and sequences in simple spoken and written situations.

Can Do Statements:

- I can talk about source code.
- I can exchange information about special features related to source code.
- I can identify information about source code in different contexts related to software programming.

Ask your partner:

- Do you know any special code for software programming? Which one?
- Which processes do you think are involved in the execution of a program?

Let's Explore!

Was the homework for today?

Instructions: Read the text below.

Pablo: Hi, Camilo. How was your class?

Camilo: It was interesting. We were at Professor Michael's programming class; we read a book about software programming, more specifically, about source codes.

Pablo: I remember something about that. The computer of the enterprise where I work uses that source.

Camilo: As a matter of fact, all computers use it.

Pablo: Ok, can you explain that to me?

Camilo: A source code is a collection of computer instructions in an easy computer language, as an ordinary text that facilitates the job of computer programmers. There are some specific features to consider, for example, the assembler.

Pablo: What does the assembler do?

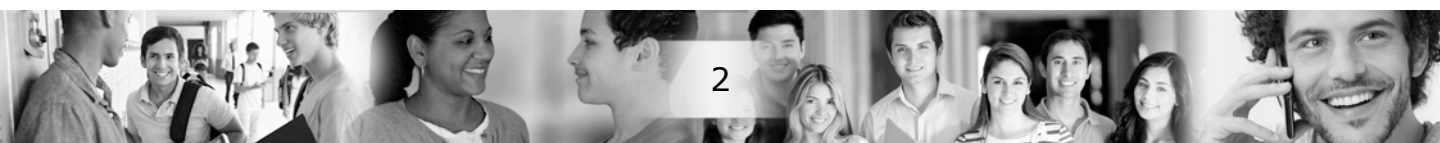

Camilo: The assembler or compiler transforms the source code into binary machine code that the computer can understand. Then the computer stores the machine code and interprets the source code for execution.

Pablo: Why is source code important?

Camilo: Programmers use the source code as an input to the process that produces programs. They can also use it as a method of communicating language algorithms; besides that, computer programmers often find it helpful when they need to review existing source code to learn how to transform programming techniques.

Pablo: So, what other features of source code did you identify?

Camilo: I found that programmers write source codes in different programming languages in order to optimize purposes. What is more, I recognized that the program was part of a source tree, and that the source code stored algorithms on the computer's hard disk as well as in a database.

Let's Practice!

Some Important Information About Source Code

Instructions: Complete the sentences by writing its corresponding word. Use capital letter where necessary. Use: facilitates the work, is a collection, code uses a, transforms the source. Compare your answers to your partner's.

1. A source code _____ of computer instructions.
2. Source _____ programming language.
3. A source code _____ of a computer programmer.
4. A compiler _____ code into binary machine code.

Let's Practice!

Some Facts About Software Programming

Instructions: Select the correct answer to correctly complete each sentence. Discuss with your partner.

1. They _____ several features, for example, the assembler.
 - a. are considering
 - b. is considering
 - c. are consider
2. A source code is a collection of computer instructions that programmers are _____ in easy programming language.
 - a. use
 - b. writing
 - c. write
3. The computer _____ the source code for execution.
 - a. are interpreting
 - b. interpreting
 - c. is storing

Extension Activity

Understanding Source Code

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about source code.
- Create a presentation explaining other aspects of source code.
- Explain to your partners what you learnt about source code.

Self-Assessment

- | | Yes | No |
|---|-----------------------|-----------------------|
| 1. I read information about source code. | ☐ | ☐ |
| 2. I write information about source code. | ☐ | ☐ |
| 3. I talk about source code. | ☐ | ☐ |
| 4. I use simple present and simple past in a correct way. | ☐ | ☐ |

Target Words

- **ordinary** (adjective): not different or special.
e.g. A source code is a collection of computer instructions in an easy computer language, as an ordinary text that facilitates the job of computer programmers.
- **enterprise** (noun): a company with commercial interests.
e.g. The computer of the enterprise where I work uses that source.
- **interpret** (verb): to infer or understand.
e.g. Then the computer stores the machine code and interprets the source code for execution.
- **helpful** (adjective): something useful and of help
e.g. Computer programmers often find it helpful when they need to review existing source code to learn how to transform programming techniques.
- **recognize** (verb): to identify something.
e.g. I recognized that the program was part of a source tree, and that the source code stored algorithms on the computer's hard disk as well as in a database.

Learning Points

Simple Past of Verb Be in Affirmative

You use the **Simple Past Tense** to express actions that started and finished in the past.

You can use the Past simple to talk about activities or situations that happened already. Use the verb **to be** in the past to talk about past time states, emotions, characteristics, and locations. The forms of the verb be in the **past** are **was** for singular and non count nouns, and **were** for plural nouns.

Examples:

*He **was** interested in the source code class.*

*We **were** at the systems lab.*

*That software **was** easy to set.*

Look at the following chart to see the subjects and their verb be form in the past.

Past of verb BE
<i>Affirmative</i>
I was a student.
You were an engineer.
He was in the school.
She was a student.
We were in the classroom.
They were students.

Examples

- I recognized that the program was part of a source tree, and that the source code stored algorithms on the computer's hard disk as well as in a database.*
- We were at Professor Michael's programming class.*

Learning Points

Simple Present Tense to Talk about General Truths

You can use the **Simple Present** to refer to routines, daily events, and things that happen regularly, or for statements that are of common knowledge.

When you express **general truths** you always use the simple present as the statement is static and not likely to change in the future; for example, the sentence "Each country has a capital city" is a universal truth and it is stated in **Simple Present**.

Notice that for the subject pronouns **I, we, you and they** the **Simple Present form** is equal to the infinitive, but for **she, he or it** you need to add **s/es** at the end of the verb. Remember that you need the auxiliary verb **do/does** (for the third person singular) for the negative and interrogative form.

Example:

*They **design** new programs.*

*They **don't design** new programs*

***Do they design** new programs?*

*He **designs** software.*

*He **doesn't design** software*

***Does** Pedro **design** software?*

Look at the following chart:

Present Simple			
	Affirmative	Negative	Questions
I/you/we/they	I find a new program. You send an email.	We don't send new products.	Do they get products?
he/she/it	He sells software.	She doesn't buy software.	Does she get the products.

Examples

- *The assembler or compiler transforms the source code into binary machine code that the computer can understand.*
- *What does the assembler do?*
- *I don't remember that.*
