Let's Start!

Codes Humans Are Able to Read

640509-040147

Learning Outcome:

Understand key information about the concepts, principles, and methodologies in simple spoken and written situations. Talk about programming techniques, use cases, kinds, and sequences in simple spoken and written situations.

Ask your partner:

- How do you think people can read codes in programming?
- What do you need to read codes? Explain?

Can Do Statements:

- I can read about human-readable medium.
- I can write sentences correctly to express my understanding about the topic.
- I can exchange information about human-readable medium with correct and precise sentences.

Let's Explore!

Let's write an essay about human-readable medium.

Instructions: Read the text below.

- Maria:** Hi, Steve, were you in the software programming class?
- Steven:** Hi! No, I wasn't there, I was in the library. I was reading about human-readable medium in computing.
- Maria:** I almost forgot! We have to write an essay about human-readable medium.
- Steven:** Yes, I want to do it step by step as the teacher told us. You know: "read about the topic and take notes of the most relevant ideas, don't copy literary from the source, support your ideas".
- Maria:** Yes, it's better to stick to the teacher's instructions. What was the title of the book you read?
- Steven:** It was a great book! It is called "Human-Readable Media, the Next Frontier". The author explains that human-readable media is a term we use not only to refer to all the data and information humans are able to understand, but also refers to short data strings that are easy to remember. I wrote some sentences about the topic, look!
- Maria:** "Programmers encode human-readable medium in languages such as ASCII and Unicode, which are far from the computers' binary representation of data". I don't understand why we cannot codify all the information into human-readable representations.
- Steven:** There wasn't enough information in the library about codification, but I know that programmers prefer binary formats because they take less space for storage; in addition to that, binary codes are the language of computers, so programs run faster when they don't need to translate text into binary representations.
- Maria:** So, what can we humans do to understand encrypted information?
- Steven:** There are some useful devices we have to use to translate the codes into human readable information; for example, those machines to read the bar-codes show us human-readable information hidden in the bars. There are also product tags with both human and machine readable data.

Let's Practice!

Were you in the programming class yesterday?

Instructions: Use the words from the box to correctly complete the sentences.

wasn't / Were / was

I ____ in the library looking for some information.

No, I _____ in class yesterday.

_____ you reading about human-readable medium?

Let's Practice!

I want you to give me some examples of human readable programming languages.

Instructions: Find the mystery word.

1. You can encode data as _____ text.

Hint: A standard that consists of a set of codes

2. To put into a code.

Hint: The action of systematizing information

Extension Activity

More about Human-Readable Medium

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for more information about human-readable medium.
- Write down a short paragraph about a device that helps humans read software codifications.
- Use the grammar covered in this lesson.
- Share the information with your partners.

Self-Assessment

Yes

No

- I search for more information about human-readable medium.
- I write a paragraph about human-readable medium.
- I use imperative sentences and the simple past to write down my ideas.
- I share my ideas with my partners.

☐	☐
☐	☐

Target Words

- **computing** (noun): the use of a computer to process data.
e.g. I was reading about human-readable medium in computing.
- **support** (verb): to help, to assist
e.g. Read about the topic and take notes of the most relevant ideas, don't copy literary from the source, support your ideas.
- **barcode** (noun): the series of identification lines printed in most of the products.
e.g. For example, those machines to read the barcodes show us human-readable information hidden in the bars.
- **be able to** (verb): to be capable of doing something
e.g. The author explains that human-readable media is a term we use not only to refer to all the data and information humans are able to understand, but also refers to short data strings that are easy to remember.
- **relevant** (adjective): Important, necessary.
e.g. Read about the topic and take notes of the most relevant ideas.
- **codify** (verb): to systematize
e.g. I don't understand why we cannot codify all the information into human readable representations.

Learning Points

Imperatives to Give Instructions

Use **imperative sentences** when you want to instruct someone to do something.

An **imperative** is a type of sentence that omits the subject and keeps the verb in its base form to give commands, orders, and instructions.

For example:

Stand up!

Listen to me!

You can also make an **imperative sentence** negative to prevent someone from doing something; to make a **negative imperative**, start the sentence with the auxiliary verb **do** and the negative particle **not**; you can also use the contraction **don't** and the base form of the verb.

For example:

Don't open that file!

Don't translate that code!

Examples

- *I wrote some sentences about the topic, look!*
- *Read about the topic and take notes of the most relevant ideas, don't copy literary from the source, support your ideas.*

Simple Past of Verb to Be in Negative and Questions

You use the **simple past** to express actions that started and finished in the past.

Remember that we use the verb **be** to talk about states, emotions, and locations; we can also use the past of the verb **be** to express the same ideas in the past. The past form of the verb **be** is **was** for singular nouns and **were** for plural nouns.

Examples:

*I **was** able to read those difficult codes.*

*We **were** happy about the new software.*

We follow the same rules as in the present to make negative and interrogative statements in the past; if we want to make a negative statement, we add the particle **not** to the verb **be**; we can also use the contractions **wasn't** and **weren't**.

Learning Points

Examples:

*We **weren't** good at reading those codes.*

*I **wasn't** comfortable with the new software.*

To make questions, we need to put the verb **be** before the subject. Remember that we can also use **Wh words** to ask open questions.

Examples:

***Were** able to read those codes?*

***Why was** that so difficult to read?*

Examples

- *Were you in the software programming class?*
- *There wasn't enough information in the library about codification.*
- *What was the title of the book you read?*

Tips for Beginner Writers

When writing a text it's important to consider the **grammar** and **punctuation rules**, but remember that there are no rules for a writing process, each person has his/ her own voice and criteria.

Let's check some general **tips for beginner writers**:

1. **Plan** your writing before you start, you can create a mind map to organize your ideas.
2. Make a frame for your text; decide on the ideas you want to tackle in each paragraph, including the opening and closing ones.
3. **Try to avoid irrelevant storylines**; write just what is relevant for the story.
4. Try to **be clear and specific** when expressing your ideas.
5. **Use connectors** between ideas and paragraphs so you give coherence to your text.
6. Try not to overuse certain words. "Just", "only", "again", "and", and "also".
7. **Be coherent** in the verbal time. Is the story set in the past, present or future?
8. **Proofread your text** to correct possible mistakes, and make sure your text is clear for everyone.
